EXP.NO: 1	8051 ASSEMBLY LANGUAGE EXPERIMENTS USING SIMULATOR
DATE:	

AIM :

APPARTUS REQUIRED :

Keil μ software

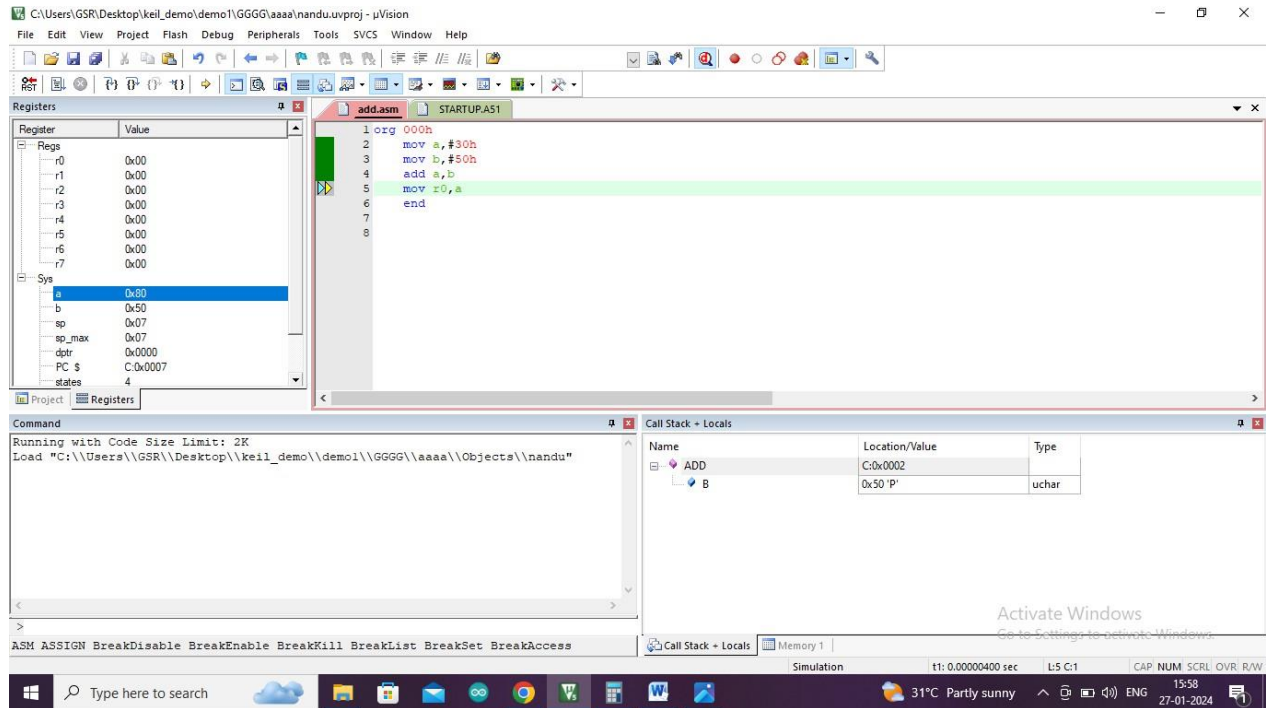

PRODURCE:

1. The 8051 microcontroller has a set of instructions for arithmetic, logic, and data manipulation operations. that demonstrates some basic ALU operations using assembly language for the 8051 microcontroller.
2. The various ALU operations, including addition, subtraction, multiplication, division, logical AND/OR/XOR, and rotation. Note that the specific instructions and registers used may vary depending on the exact 8051 microcontroller variant you are working with.
3. Always refer to the datasheet or reference manual for your specific microcontroller to ensure accurate programming.

PROGRAM :

```
org 000h
mov a,#30h
mov b,#50h
add a,b
mov r0,a
end
```

OUTPUT:

RESULT:

EXP.NO: 2	TEST DATA TRANSFER BETWEEN REGISTER AND MEMORY
DATE:	

AIM:

APPARTUS REQUIRED :

Keil μ software

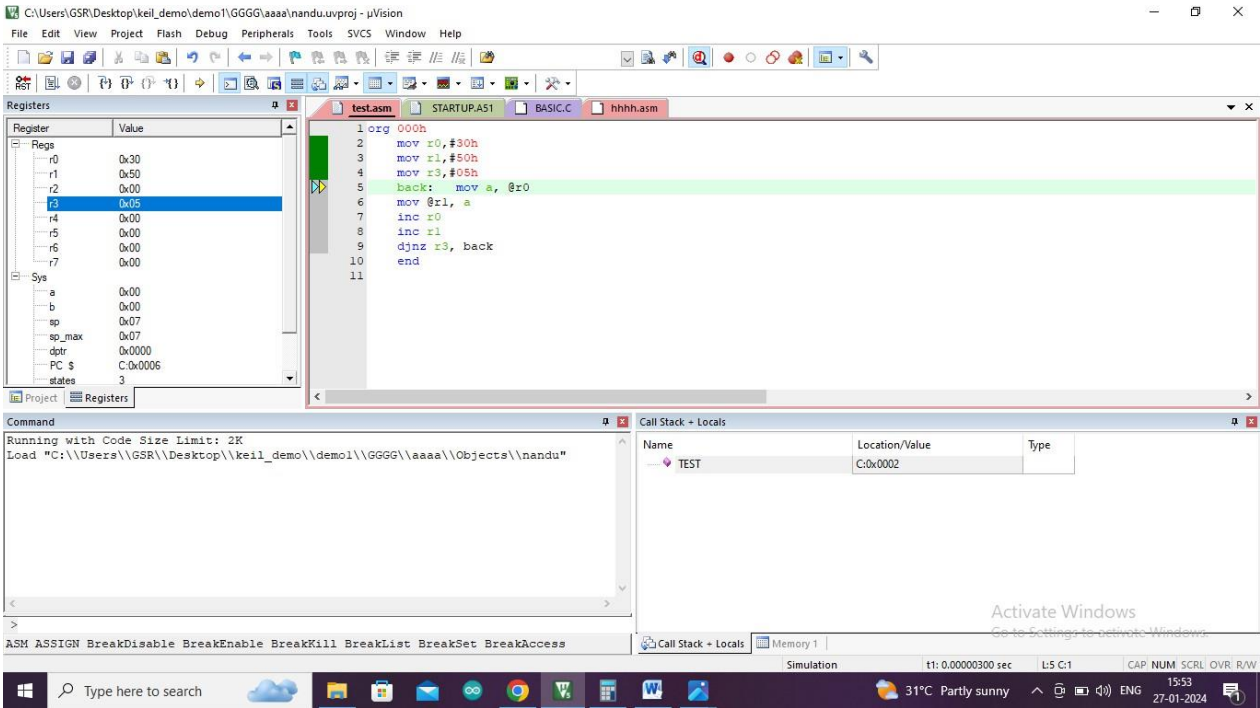

PRODURCE:

2. The various ALU operations, including addition, subtraction, multiplication, division, logical AND/OR/XOR, and rotation. Note that the specific instructions and registers used may vary depending on the exact 8051 microcontroller variant you are working with.
3. Always refer to the datasheet or reference manual for your specific microcontroller to ensure accurate programming.

PROGRAM :

```
org 000h
    mov r0,#30h
    mov r1,#50h
    mov r3,#05h
back:  mov a, @r0
    mov @r1, a
    inc r0
    inc r1
    djnz r3, back
    end
```

OUTPUT:

RESULT:

EXP.NO: 3	PERFORM ALC OPERATIONS
DATE:	

AIM :

TO PERFORM ALC OPERATIONS

APPARTUS REQUIRED :

Keil μ software

PRODURCE:

1. The 8051 microcontroller has a set of instructions for arithmetic, logic, and data manipulation operations. that demonstrates some basic ALU operations using assembly language for the 8051 microcontroller.
2. The various ALU operations, including addition, subtraction, multiplication, division, logical AND/OR/XOR, and rotation. Note that the specific instructions and registers used may vary depending on the exact 8051 microcontroller variant you are working with.
3. Always refer to the datasheet or reference manual for your specific microcontroller to ensure accurate programming.

PROGRAM :

```
org 00h
    sjmp start
    org 30h
        start:
            mov a,#01h
            mov b,#02h
            add a,b
            mov r0,a
            mov a,#01h
            subb a,b
            mov r1,a
            mov a,#01h
            anl a,b
            mov r3,a
            mov a, #01h
            orl a,b
            mov r4,a
            mov a, #01h
            xrl a,b
            mov a,r5

        end
```

OUTPUT:

RESULT:

EXP.NO: 5	INTRODUCTION TO ARDUINO PLATFORM AND PROGRAMMING
DATE:	

AIM :

Objective:

- ❖ The objective of this lab experiment is to interface a buzzer with an Arduino and create a simple program to control the buzzer for different sounds and tones.

Equipment and Components:

- ❖ thingZkit IoT Board
- ❖ Jumper wires
- ❖ USB cable for Arduino Uno.
- ❖ Power Adapter Cable(12V/3A) for thingZkit IoT
- ❖ Computer with Arduino IDE installed.

Theory:

- ❖ A buzzer is an electronic component that produces sound when an electrical signal is applied to it. It is commonly used in various electronic devices and projects for auditory feedback, alarms, and signaling purposes.

Connection Diagram:

Pin Details:

thingZkit IoT-ARDUINO	Buzzer
8	BUZR
GND	GND

Procedure:

Setup Hardware:

- ❖ Connect your thingZkit IoT to your computer using the USB cable.
- ❖ Connect pin 8 of the Arduino to the onboard Buzzer.
- ❖ Ensure that the connections are secure and free from any short circuits.

Setup Software:

- ❖ Power on the thingZkit IoT board
- ❖ Open the Experiment 6 program in Arduino platform from the given source code folder

Upload Code:

- ❖ Click the "Upload" button in the Arduino IDE to upload the code to your Arduino board.

Note: Uploading or Flashing Procedure refer Annexure -I

Test the Experiment:

- ❖ Once the code is uploaded, observe the different sounds produced by the buzzer.

Result:

EXP.NO: 6	EXPLORE DIFFERENT COMMUNICATION METHODSWITH IOT DEVICES
DATE:	

AIM:

Objective:

- ❖ The objective of this hands-on lab experiment is to demonstrate the process of interfacing a Bluetooth module (specifically HC-05) with an Arduino board to wirelessly control the state of an LED. This experiment provides practical experience in combining hardware components and programming to create a Bluetooth-controlled LED system.

Equipment and Components:

- ❖ thingZkit IoT Board
- ❖ Jumper wires
- ❖ USB cable for Arduino Uno.
- ❖ Power Adapter Cable(12V/3A) for thingZkit IoT
- ❖ Computer with Arduino IDE installed.

Theory:

- ❖ Bluetooth is a wireless communication standard designed for short-range communication between devices. Bluetooth modules, such as the HC-05 and HC-06, are widely used in electronics projects to enable wireless communication between microcontrollers, like Arduino, and other devices like smartphones, tablets, or other Bluetooth-enabled gadgets.

Connection Diagram:

Pin Details:

thingZkit IoT-ARDUINO	Bluetooth Module & LED
Pin 2	TX
Pin 3	RX
5V	5V/3V
Pin 13	External LED (Long leg terminal)
GND	LED Short leg terminal

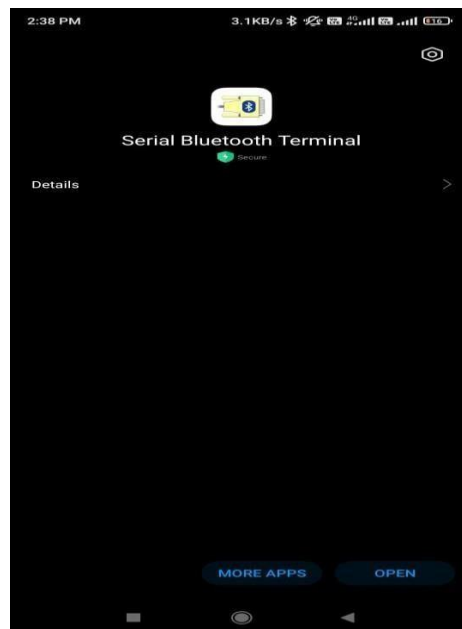

Procedure:

Setup Hardware:

- ❖ Connect your Arduino to your computer using the USB cable.
- ❖ Connect the Inbuilt Bluetooth Module with Arduino as described above
- ❖ Place the LED on the breadboard and connect it to the Arduino as described above.
- ❖ Ensure that all connections are secure and free from short circuits.

Setup Software:

- ❖ Power on the thingZkit IoT board
- ❖ Open the Experiment 15 program in Arduino platform from the given source code folder
- ❖ Install the **mobile App** from the **Google Play Store**,

Upload Code:

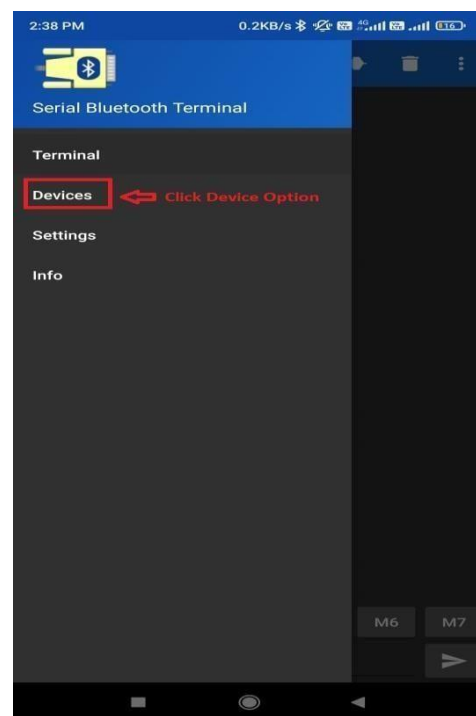

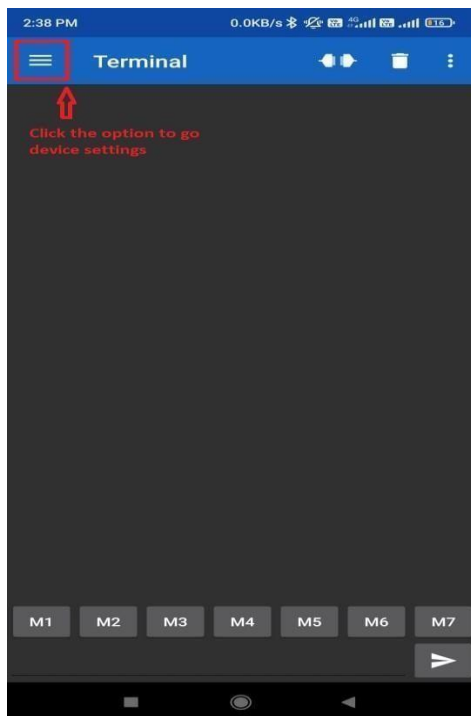

- ❖ Click the “Upload” button in the Arduino IDE to upload the code to your Arduino board.

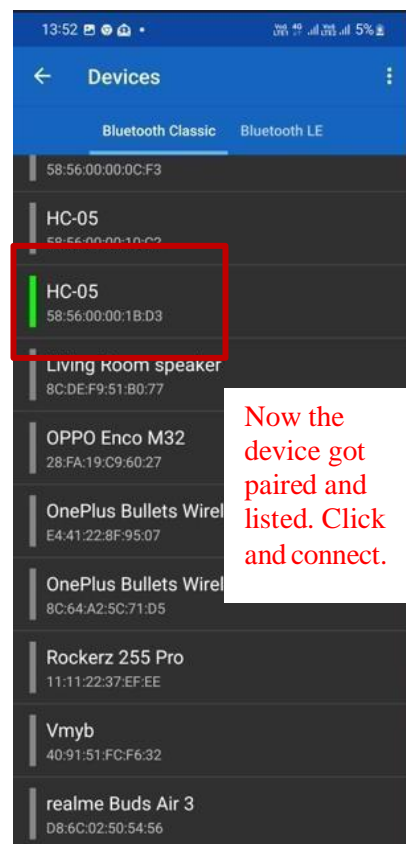

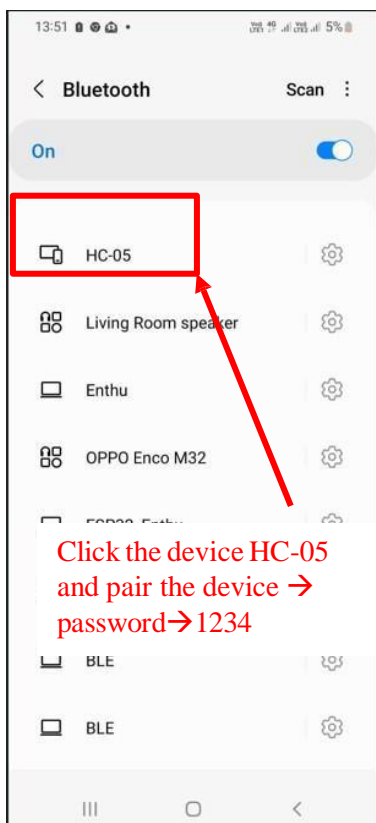

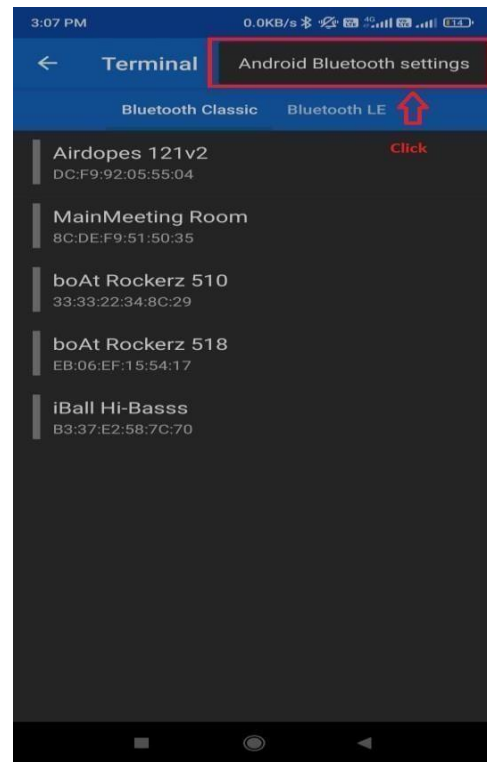

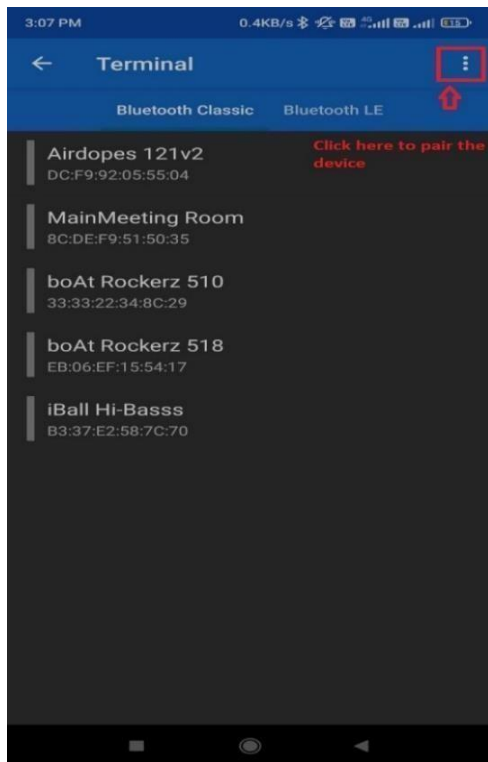

Note: Uploading or Flashing Procedure refer Annexure -I

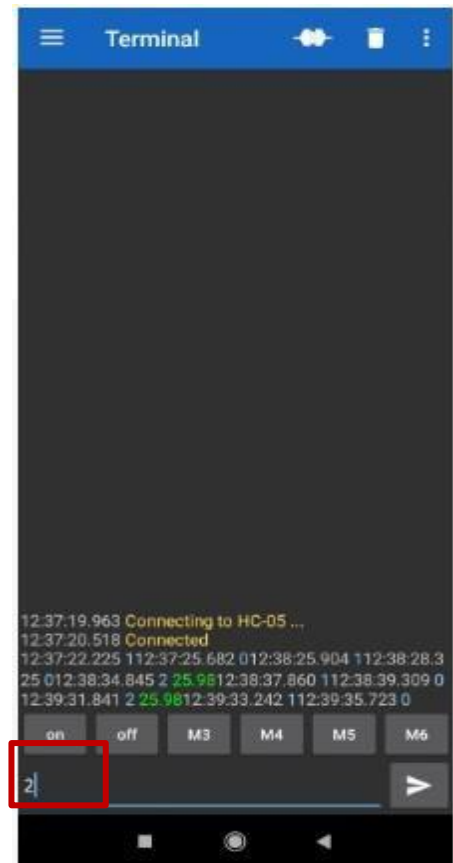

Open Serial Monitor:

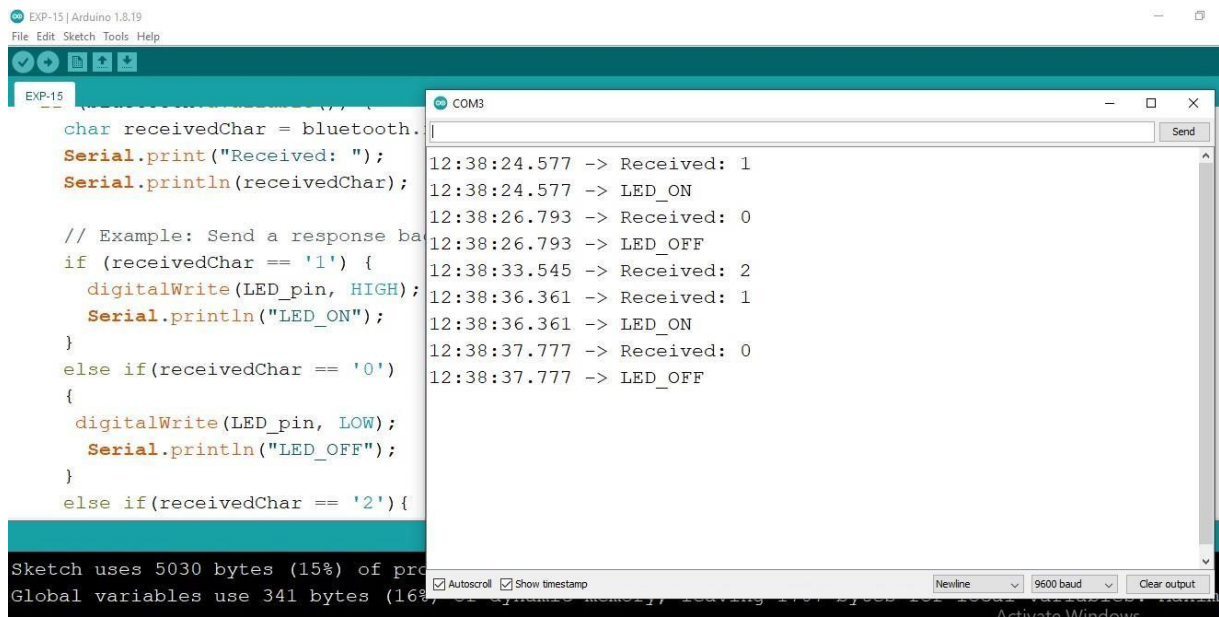

- ❖ Open the Arduino Serial Monitor from the Arduino IDE.
- ❖ Ensure that the baud rate in the Serial Monitor matches the baud rate in the Arduino code (in this case, 9600).
- ❖ Turn on Bluetooth in mobile. Open the App and follow the steps as mentioned in the below image,

- ❖ Observe the output in the serial monitor & the hardware

Test the Experiment:

- ❖ In the Serial Monitor, if the received character is '1' it turn the LED on, and if received character is '0' to turn the LED off.

Results:

EXP.NO: 7	INTRODUCTION TO RASPBERRY PI PLATFORM AND PYTHON PROGRAMMING
DATE:	

AIM:

Objective:

- ❖ The objective of this experiment is to interface a On Board pull-up push button with Pico control on the thingZkit IoT board. This experiment will demonstrate how to read the state of the push button and perform actions based on its status.

Equipment and Components:

- ❖ thingZkit IoT development board
- ❖ Jumper wires
- ❖ USB cable for PI-PICO.
- ❖ Power Adapter Cable(12V/3A) for ThingZkit IoT
- ❖ Computer with Thonny software installed.

Theory:

- ❖ In this experiment, we will interface a on Board pull-up push button with thingZkit IoT using Pico control. The pull-up configuration ensures that the input pin reads a high logic level when the button is not pressed and a low logic level when the button is pressed. Thonny software will be used for coding and uploading the program to thingZkit IoT.

Connection Diagram:

Pin Details:

PICO Controller	Push Button (Pull Up)
GP16	SW1

Experiment Setup:

Hardware Connection:

- ❖ Connect the On-Board pull-up push button to thingZkit IoT as per the Connection Diagram above.
- ❖ Connect the On-Board pull-up push button to thingZkit IoT (SW1 – GPIO 16 Pin)
- ❖ Ensure that the connections are secure, and the components are properly seated on the board.

thingZkit IoT Configuration:

- ❖ Connect thingZkit IoT to your computer using the USB cable.
- ❖ Open Thonny software and select the appropriate board and port.
- ❖ Open the Code Folder using Thonny Software.
- ❖ Upload the code and observe the output on the Thonny shell.

Note: Uploading or Flashing Procedure refer Annexure -I

Results:

EXP.NO: 8	INTRODUCTION TO RASPBERRY PI PLATFORM AND PYTHON PROGRAMMING
DATE:	

AIM:

Objective:

- ❖ The objective of this experiment is to interface an On Board pull-Down push button with Pico control on the thingZkit IoT board. This experiment will demonstrate how to read the state of the push button and perform actions based on its status.

Equipment and Components:

- ❖ thingZkit IoT development board
- ❖ Jumper wires
- ❖ USB cable for PI-PICO.
- ❖ Power Adapter Cable(12V/3A) for ThingZkit IoT
- ❖ Computer with Thonny software installed.

Theory:

- ❖ In this experiment, we will interface a on Board Pull-Down push button with thingZkit IoT using Pico control. The pull-up configuration ensures that the input pin reads a low logic level when the button is not pressed and a high logic level when the button is pressed. Thonny software will be used for coding and uploading the program to thingZkit IoT.

Connection Diagram:

Pin Details:

PICO Controller	Push Button (Pull Down)
GP16	SW2

Experiment Setup:

Hardware Connection:

- ❖ Connect the On-Board pull-down push button to thingZkit IoT as per the Connection Diagram above.
- ❖ Connect the On-Board pull-up push button to thingZkit IoT (SW2 – GPIO 16 Pin)
- ❖ Ensure that the connections are secure, and the components are properly seated on the board.

thingZkit IoT Configuration:

- ❖ Connect thingZkit IoT to your computer using the USB cable.
- ❖ Open Thonny software and select the appropriate board and port.
- ❖ Open the Correct Code folder.
- ❖ Upload the code and observe the output on the Thonny shell.

Note: Uploading or Flashing Procedure refer Annexure -I

Results:

EXP.NO: 9	INTERFACING SENSOR WITH RASPBERRY PI.
DATE:	

AIM:

Objective:

- ❖ The objective of this experiment is to interface the onboard IR sensor with Pico on the thingZkit IoT board. This experiment will demonstrate how to read the infrared signals from the onboard IR sensor.

Equipment and Components:

- ❖ thingZkit IoT development board
- ❖ Jumper wires
- ❖ USB cable for PI-PICO.
- ❖ Power Adapter Cable(12V/3A) for ThingZkit IoT
- ❖ Computer with Thonny software installed.

Theory:

- ❖ In this experiment, we will interface the onboard IR sensor with thingZkit IoT using Pico control. The onboard IR sensor is a built-in component on the thingZkit IoT board. Thonny software will be used for coding and uploading the program to thingZkit IoT.

Connection Diagram:

Pin Details:

PICO Controller		IR Sensor	
GP14		OUT	

Experiment Setup:

Hardware Connection:

- ❖ Connect the On-Board IR Sensor to thingZkit IoT as per the Connection Diagram above.
- ❖ Connect the On Board IR Sensor to thingZkit IoT (OUT– GPIO 14 Pin)
- ❖ Ensure that the connections are secure, and the components are properly seated on the board.

thingZkit IoT Configuration:

- ❖ Connect thingZkit IoT to your computer using the USB cable.
- ❖ Open Thonny software and select the appropriate board and port.
- ❖ Open the Correct Code folder.
- ❖ Upload the code and observe the output on the hardware and Thonny shell.

Note: Uploading or Flashing Procedure refer Annexure -I

Results:

EXP.NO: 10	LOD DATA USING RASPBERRY PI AND UPLOAD TO THE CLOUD PLATFORM
DATE:	

AIM:

Objective:

- ❖ The objective of this experiment is to control the onboard LED and push random data to the cloud using Wi-Fi and the HTTP protocol with Pico on the ThingZkit IoT board. This experiment will demonstrate how to establish a Wi-Fi connection, control the onboard LED, and send data to the thingZmate cloud.

Equipment and Components:

- ❖ thingZkit IoT development board
- ❖ Jumper wires
- ❖ USB cable for PI-PICO.
- ❖ Power Adapter Cable(12V/3A) for ThingZkit IoT
- ❖ Computer with Thonny software installed.
- ❖ Cloud platform account (e.g., ThingZmate)

Theory:

- ❖ In this experiment, we will use the Wi-Fi capability of thingZkit IoT to connect to a Wi-Fi router. The onboard LED connected to Pin 6 will be controlled based on commands received over the Wi-Fi HTTP connection.
- ❖ Additionally, random data will be generated and sent to a thingZmate cloud platform using HTTP requests.

Connection Diagram:

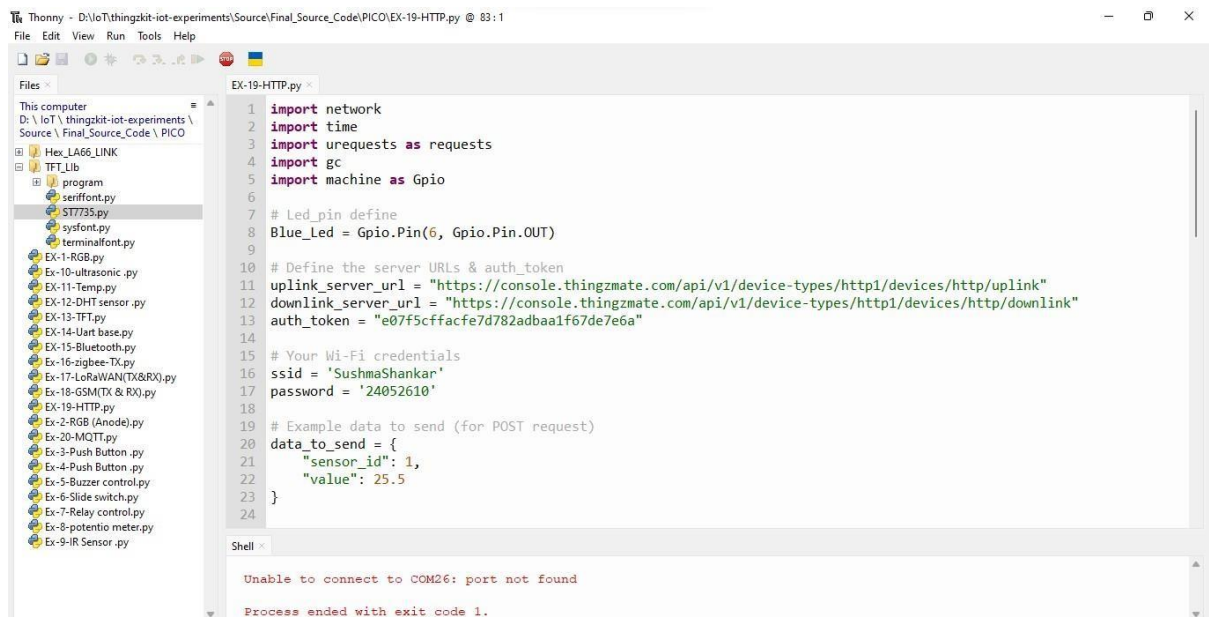

Pin Details:

PICO	RGB (Common Cathode)
GP6	R

Configuration Steps:

❖ Open the HTTP code using Thonny Software

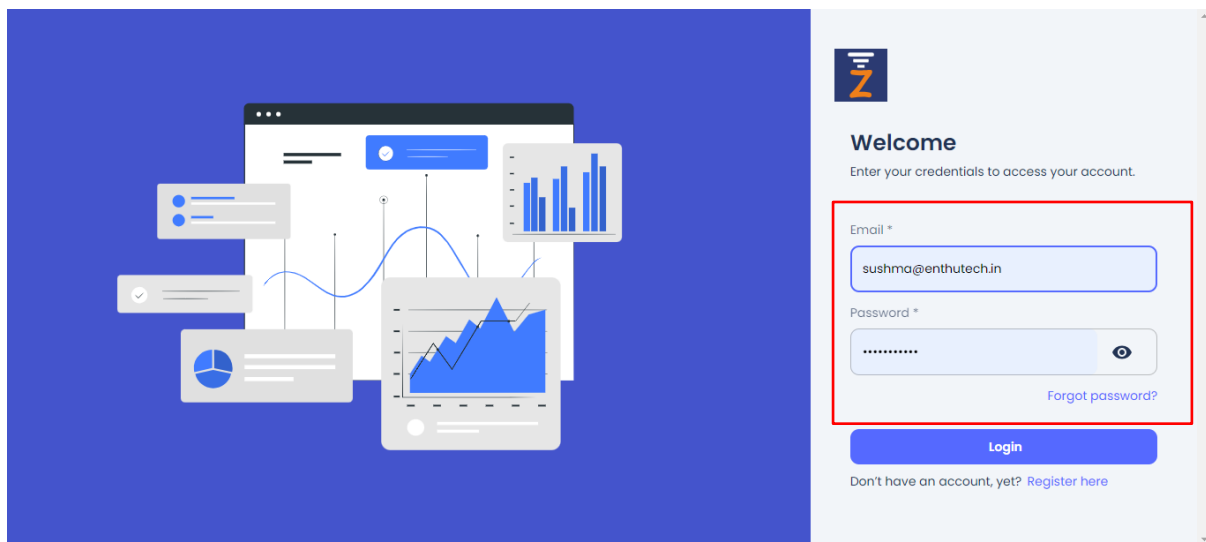

```
1 import network
2 import time
3 import urequests as requests
4 import gc
5 import machine as Gpio
6
7 # Led pin define
8 Blue_Led = Gpio.Pin(6, Gpio.Pin.OUT)
9
10 # Define the server URLs & auth_token
11 uplink_server_url = "https://console.thingzmate.com/api/v1/device-types/http1/devices/http/uplink"
12 downlink_server_url = "https://console.thingzmate.com/api/v1/device-types/http1/devices/http/downlink"
13 auth_token = "e07f5cfffacfe7d782adbaa1f67de7e6a"
14
15 # Your Wi-Fi credentials
16 ssid = 'SushmaShankar'
17 password = '24052610'
18
19 # Example data to send (for POST request)
20 data_to_send = {
21     "sensor_id": 1,
22     "value": 25.5
23 }
24
```

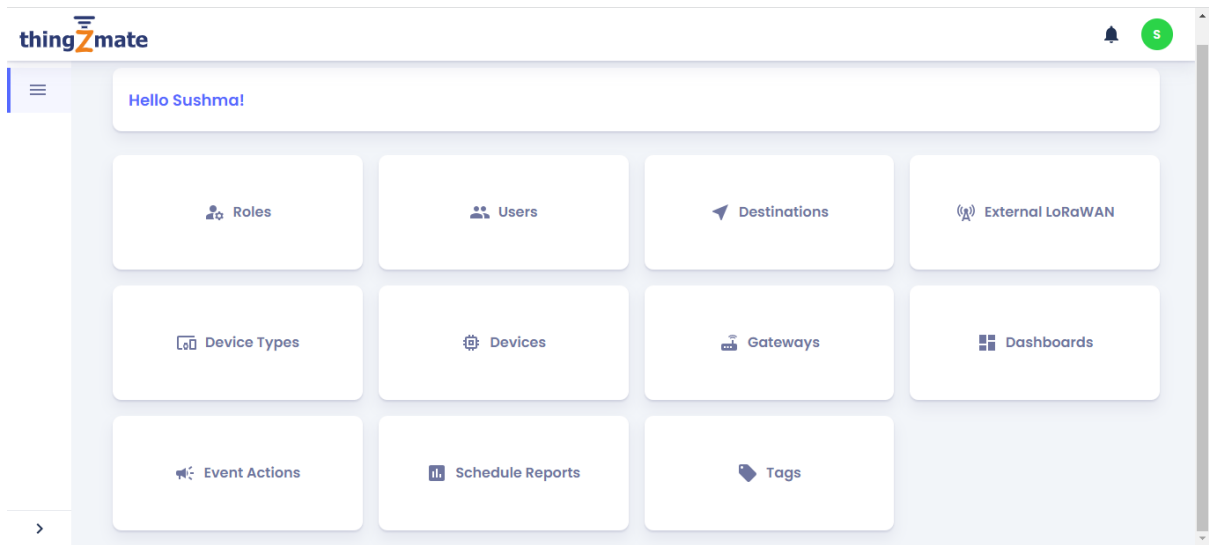

Unable to connect to COM26: port not found

Process ended with exit code 1.

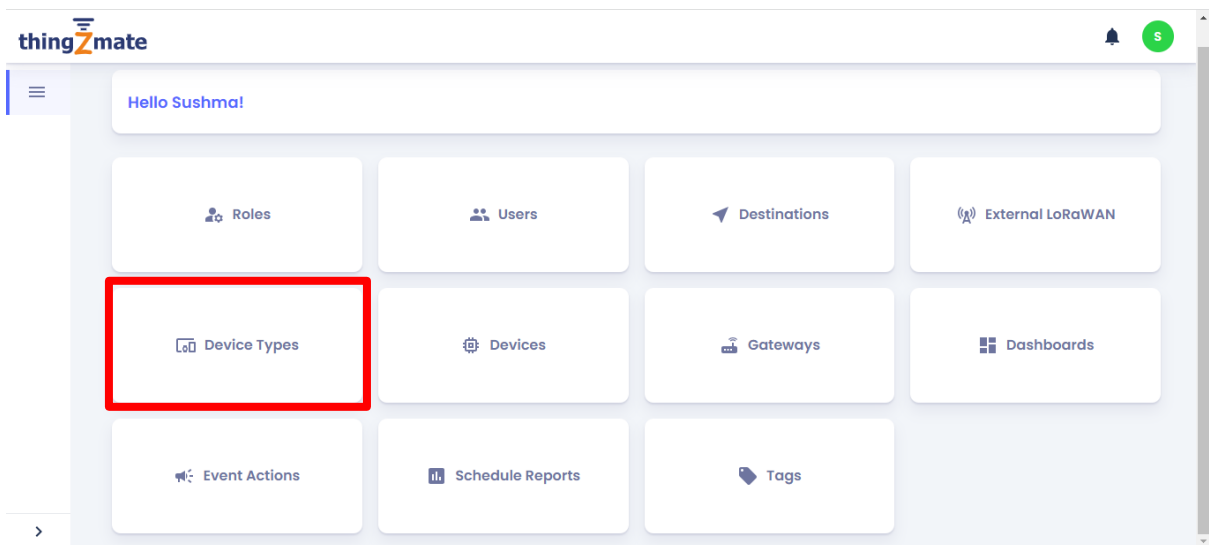

❖ Open thingZmate Cloud plat form and create an account

- ❖ After Login the thingZmate Cloud platform user can see the thingZmate Home page

- ❖ Click the Device Types

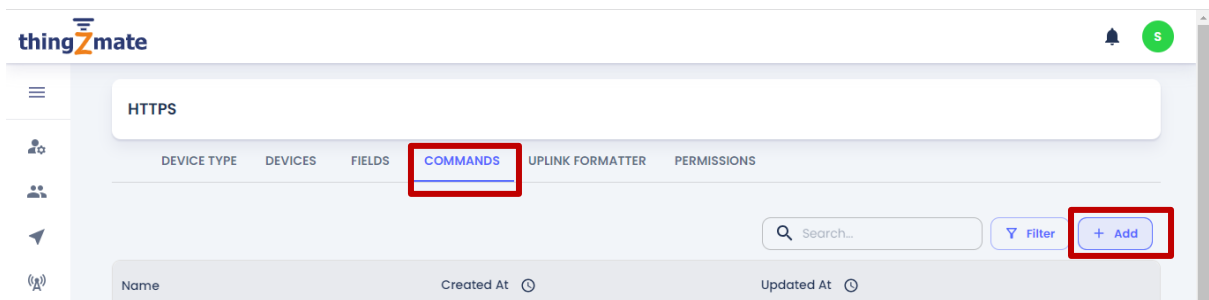

❖ Click ADD button in Device Types page.

❖ User Can set ID and Name and select Transport Protocol has HTTPS and click Save Button

The screenshot shows the 'Add Device Type' form. It has four main input fields: 'ID *' with the value 'http', 'Name *' with the value 'LED_Control_HTTP', 'Transport Protocol *' with a dropdown menu showing 'HTTPS', and 'Description' with the placeholder text 'Enter the Description'. At the bottom right, there is a 'Save' button, which is highlighted with a red box. A 'Cancel' button is at the bottom left.

❖ After Saving the Device Types → Select **COMMANDS** Field → Click Add Button

- ❖ User can Enter the Command name, parameter name , parameter Key and Type Downlink payload formatter

The screenshot shows the 'Downlink Payload Formatter' interface. It includes a 'Name *' field with the value 'Brightness_Level_1'. Below it is a table with a 'value' button and an 'Add New' button. The 'Parameter Key *' field contains 'value', and the 'Parameter Name *' field also contains 'value'. The 'Parameter Type' dropdown is set to 'Static'. To the right, the 'Use Formatter' checkbox is checked, and a code editor shows a JavaScript function:

```
1 function Decoder(data) {  
2   return data.value  
3 }
```

. Red arrows point from text labels to the interface: 'Enter the name' points to the 'Parameter Name' field, and 'Enter the parameter name' points to the 'Parameter Key' field. A label 'Downlink Payload Formatter' points to the code editor area.

Annotations:

- Enter the name
- Enter the parameter name
- Downlink Payload Formatter

- ❖ Enter the parameter Type → Dynamic.
- ❖ Select Data Type → Text.
- ❖ Select Value Restriction → Allowed Values
- ❖ Enter the Command Label Name
- ❖ Enter the Value → 1 → LED ON → 2 → LED OFF
- ❖ Select Insert Mode → Replace.
- ❖ Select Content Type → Text

The screenshot shows the 'Downlink Payload Formatter' interface with the following settings:

- Parameter Type:** Dynamic
- Data Type *:** Text
- Value Restriction *:** Allowed Values
- Label *:** LED ON, LED OFF
- Value *:** 1, 2
- Insert Mode:** Push, Replace (selected)
- Content Type:** Text (selected), JSON

Annotations:

- Enter the parameter Type → Dynamic.
- Select Data Type → Text.
- Select Value Restriction → Allowed Values
- Enter the Command Label Name
- Enter the Value → 1 → LED ON → 2 → LED OFF
- Select Insert Mode → Replace.
- Select Content Type → Text

- ❖ Select the Fetch Method → Use Downlink URL
- ❖ Click Save Button
